# Notice

# Submission

---

- Deadline: 23:59:59, Sunday, May 24<sup>th</sup>, 2026 (KST, +0900)
  - GitHub server clock
- To submit your assignment, two things **must** be done BEFORE deadline.
  - You must push your commit to your repository
  - You must comment the last commit id (SHA-1 hash) in github issue board
  - You must match username of pushed commits with GitHub username
- The last commit **in the issue board** BEFORE deadline will be considered as submitted assignment.
  - Local timestamp in your commit will be ignored. GitHub server timestamp used instead

chore: write a report. e54aaa9 3

g1r4ff3 committed 1 minute ago

Copy full SHA for e54aaa9

1. Go to your assignment repository
2. Click "Commits"
3. Click copy button of your last commit

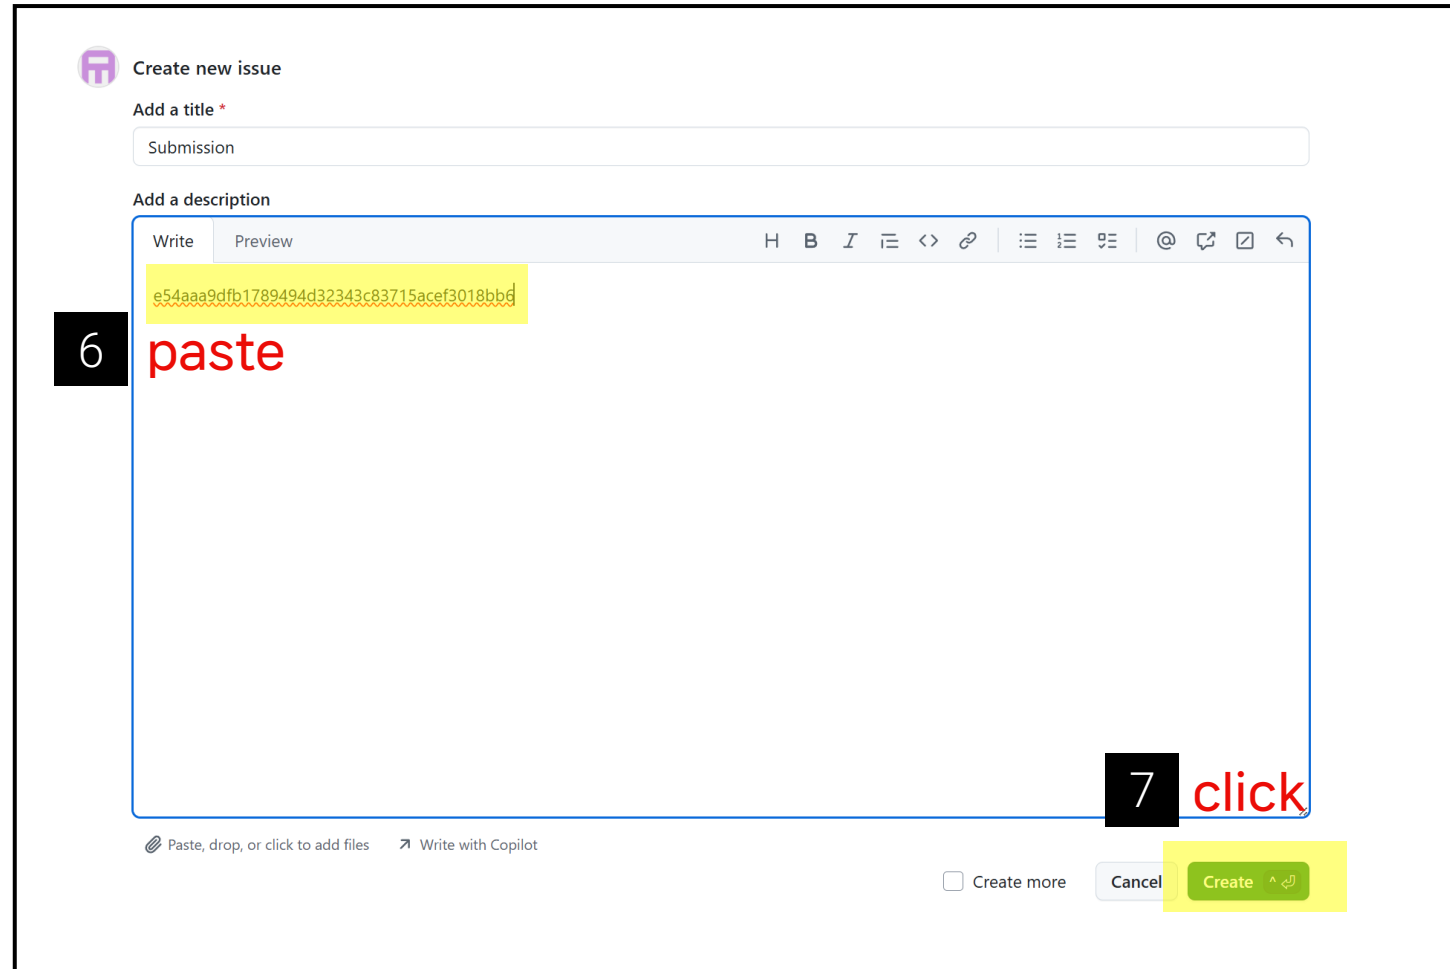

# How to comment a commit id

The screenshot shows the GitHub interface for a repository named 'CGLAB-Classes / programming-assignment-1-g1r4ff3-1'. The 'Issues' tab is selected and highlighted in yellow, with a black box containing the number '4' and the word 'click' in red text next to it. Below the navigation bar, there is a search bar with the text 'is:issue state:open' and a search icon. To the right of the search bar are buttons for 'Labels', 'Milestones', and a green 'New issue' button, which is also highlighted in yellow with a black box containing the number '5' and the word 'click' in red text. Below the search bar, there are filters for 'Open' (0) and 'Closed' (0), and a list of filter options: Author, Labels, Projects, Milestones, Assignees, Types, and Newest. The main content area displays 'No results' and 'Try adjusting your search filters.'

4. Go to issues tab
5. Click "New Issue"

# How to comment a commit id

6. Paste your latest commit id (ctrl-v)
7. Click "Create"

# Policies

---

- In following cases, your grade for this PA will be "0"
  - Late submission
    - late push after deadline or late last commit id comment on issue board
  - Build/execution failure
  - Making public of your assignment repository
  - Mismatch of username in a submitted local commit with the submitter's GitHub username
  - API use of a library that gives the solution directly, instead of working your assignment on your own
- Your final grade will be "F"
  - Copy (We will run a copy detector)

# Assignment Overview

# Task 1. Whitted Ray Tracer

---

- You will implement Whitted ray tracer that can generate lighting effects like reflections or refractions
  - Refer to the "Whitted Ray Tracing" lecture note in the course page or the original paper [1]
- **Implementation constraints**
  1. Generate two secondary rays at surface, one for reflection and the other for refraction
  2. Use the provided material classes for shading: WhittedMaterial/CheckerMaterial
  3. Determine how refractive rays interact at the surface
    - [Total internal reflection](#) [2]: the refraction case falls back to a reflection case
    - Fresnel equation (or Schlick approximation): how much the light energy should be distributed into reflection and refraction
- **Note**
  - The Whitted ray tracer is not based on physics; it is a hybrid method that balances local and global illumination models, i.e. deterministic ray tracer
  - From this assignment, a rendering result is a single image not a sequence of images (i.e. video)

[1] T. Whitted. An improved illumination model for shading display. Communications of the ACM, 23(6):343–349, 1980

# Initial Appearance

---

- Skeleton code is only able to draw sky-gradient background for a sample scene (scenes/sample.xml)

Task 1 finished

# Scene description with xml

- From this assignment, you can describe a scene using xml as follows:
  - Top level tag: this must be a scene
  - Fields in each tag: you can find how to specify the parameters in their codes
  - For more information, refer to README.md in the repository

```
scenes > sample.xml
1  <!-- Sample scene: one diffuse sphere on the same checker stage used by
2     scenes/sphere/front.xml and scenes/ajax/front.xml. Renders as the sky
3     gradient until Li(), Sphere::rayIntersect, and the acceleration
4     structure are implemented. -->
5  <scene>
6     <integrator type="whitted_integrator">
7         <integer name="maxDepth" value="8"/>
8     </integrator>
9
10    <camera type="perspective">
11        <integer name="width" value="512"/>
12        <integer name="height" value="512"/>
13        <float name="fov" value="45"/>
14        <transform name="toWorld">
15            <lookat origin="0, 2, 5" target="0, 0.5, 0" up="0, 1, 0"/>
16        </transform>
17    </camera>
18
19    <!-- Checker floor -->
20    <mesh type="obj">
21        <string name="filename" value="../meshes/plane.obj"/>
22        <material type="checker">
23            <color name="color1" value="0.9, 0.9, 0.9"/>
24            <color name="color2" value="0.15, 0.15, 0.15"/>
25            <float name="scale" value="0.8"/>
26        </material>
27    </mesh>
28
```

src/perspective.cpp

```
29
30 <!-- Checker back wall -->
31 <mesh type="obj">
32     <string name="filename" value="../meshes/plane.obj"/>
33     <transform name="toWorld">
34         <rotate angle="90" axis="1, 0, 0"/>
35         <translate value="0, 3, -3"/>
36     </transform>
37     <material type="checker">
38         <color name="color1" value="0.2, 0.4, 0.8"/>
39         <color name="color2" value="0.95, 0.95, 0.85"/>
40         <float name="scale" value="0.5"/>
41     </material>
42 </mesh>
43
44 <!-- Diffuse (red) sphere - center -->
45 <primitive type="sphere">
46     <point name="center" value="0, 0.5, 0"/>
47     <float name="radius" value="0.5"/>
48     <material type="whitted">
49         <color name="Kd" value="0.85, 0.2, 0.2"/>
50     </material>
51 </primitive>
52
53 <light type="point">
54     <point name="position" value="3, 4, 3"/>
55     <color name="intensity" value="40, 40, 40"/>
56 </light>
57
58 <!-- Ambient color -->
59 <color name="ambient" value="0.08, 0.08, 0.08"/>
60 </scene>
```

# Test Scene: Sphere

---

- Spheres are present in a row with different material parameters (scenes/sphere/front.xml)
  - Checker material is provided; Check your skeleton repository

# Task 2. Octree

- Hierarchical spatial data structure that
  - divides space of whole scene or single geometry by octants recursively
  - enables fast searching an intersection point of a dense geometry in  $O(\log N)$  time

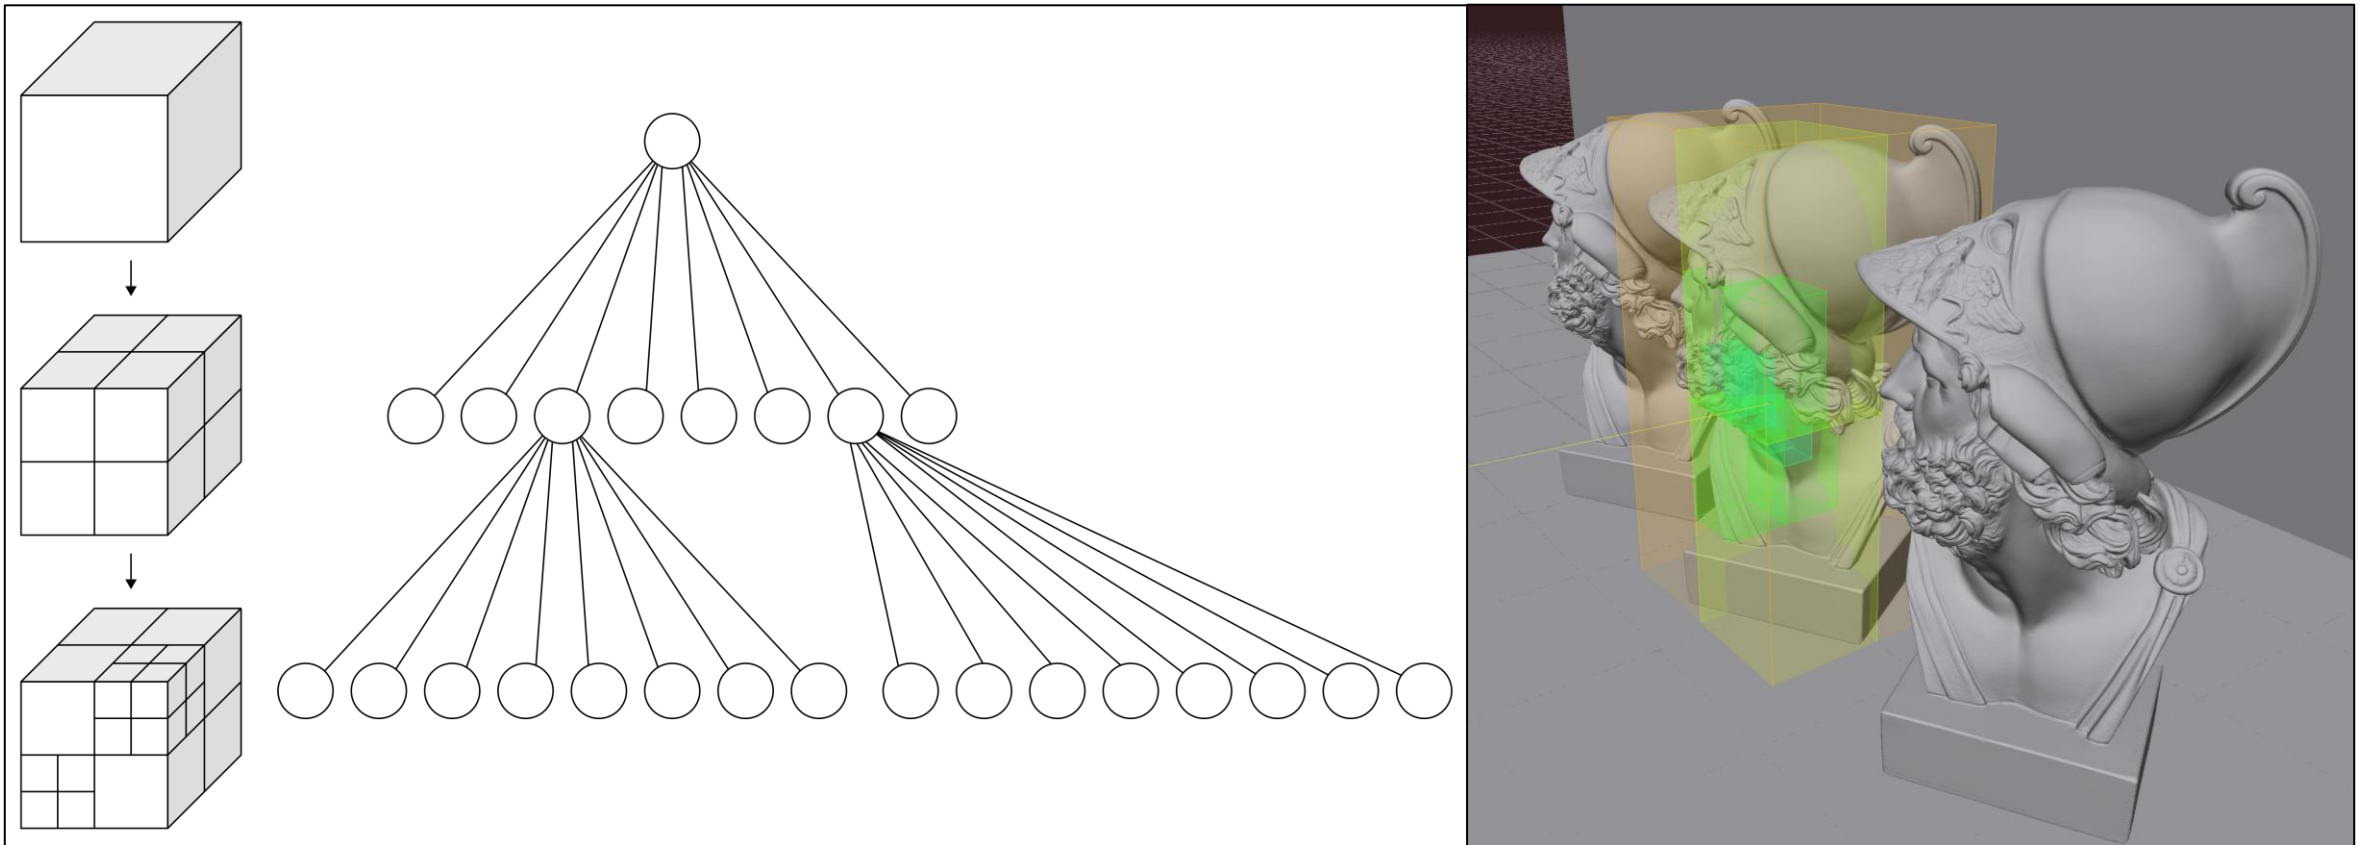

Image source: <https://en.wikipedia.org/wiki/Octree>

# Octree Construction

- Algorithm
  1. Start with a root bounding box at scene level
  2. Split the current box by 8 octants
  3. For primitives, test overlaps with their children and classify them into their appropriate nodes
  4. Recursively do the items 2 & 3 for children until a base condition is met
    - For example, you can stop splitting a box with fewer than 10 triangles

```
1 Node *build(bounding box, triangles) {  
    if (no triangles)  
        return nullptr;  
  
    if (only few triangles) "few triangles" means less than 10 triangles  
        return new leaf node with triangles;  
  
2 triangle_list list[8];  
  
3 for (every triangle) {  
    for (int i = 0; i < 8; ++i) {  
        if (triangle overlaps sub-node i)  
            add to list[i];  
    }  
}  
  
4 Node *node = new Node();  
    for (int i = 0; i < 8; ++i)  
        node.child[i] = build(bounding box of sub-node i, list[i]);  
    return node;  
}
```

Figure 1. pseudocode for building an octree when there are only meshes

# Ray traversal

---

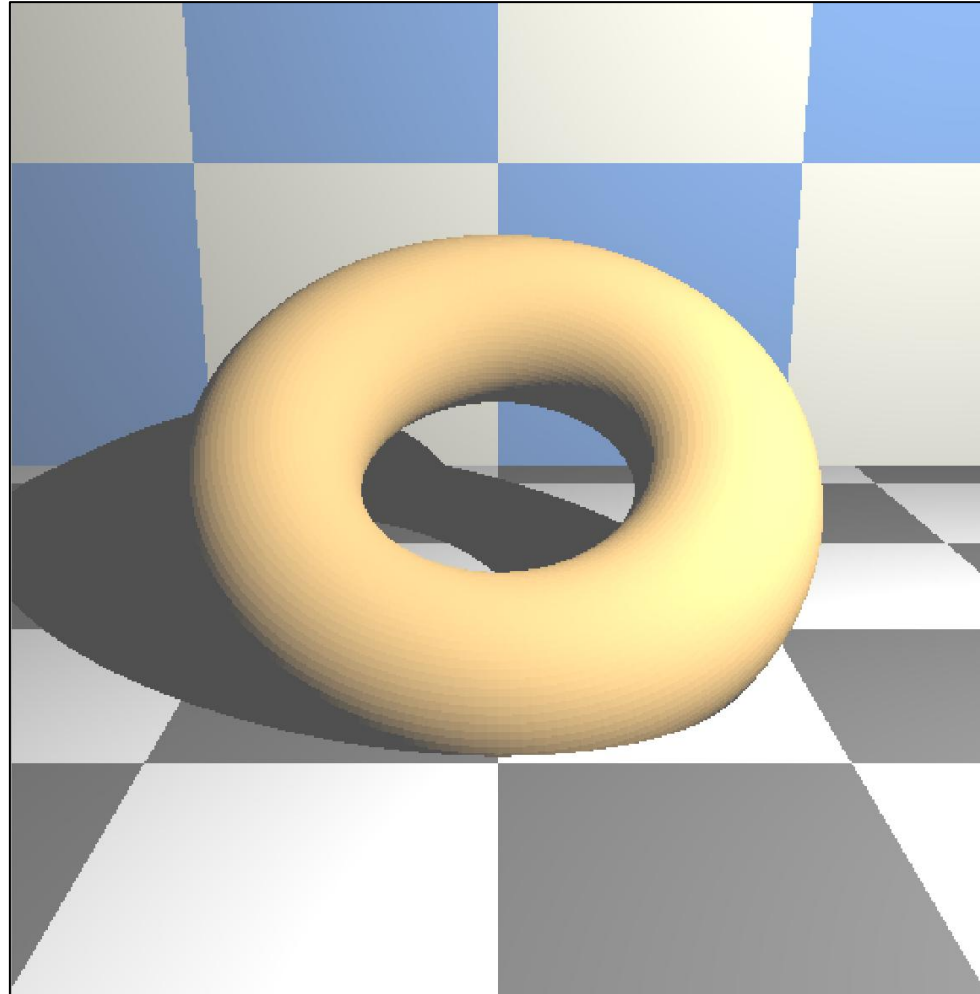

- Once you have built the octree, you need to know how to trace it
  - Goal: figure out how to implement the ray traversal
- Algorithm
  1. Test the ray against the current node's bounding box (AABB)
  2. If the ray hit a leaf node, intersect the ray with all contained primitives
  3. Otherwise, recurse into children sorted by ray hit distance

# Development Scene: Torus

---

- Torus mesh with about 30K triangles is displayed in front of the camera (scenes/torus/front.xml)
  - Checker material is provided; Check your skeleton repository

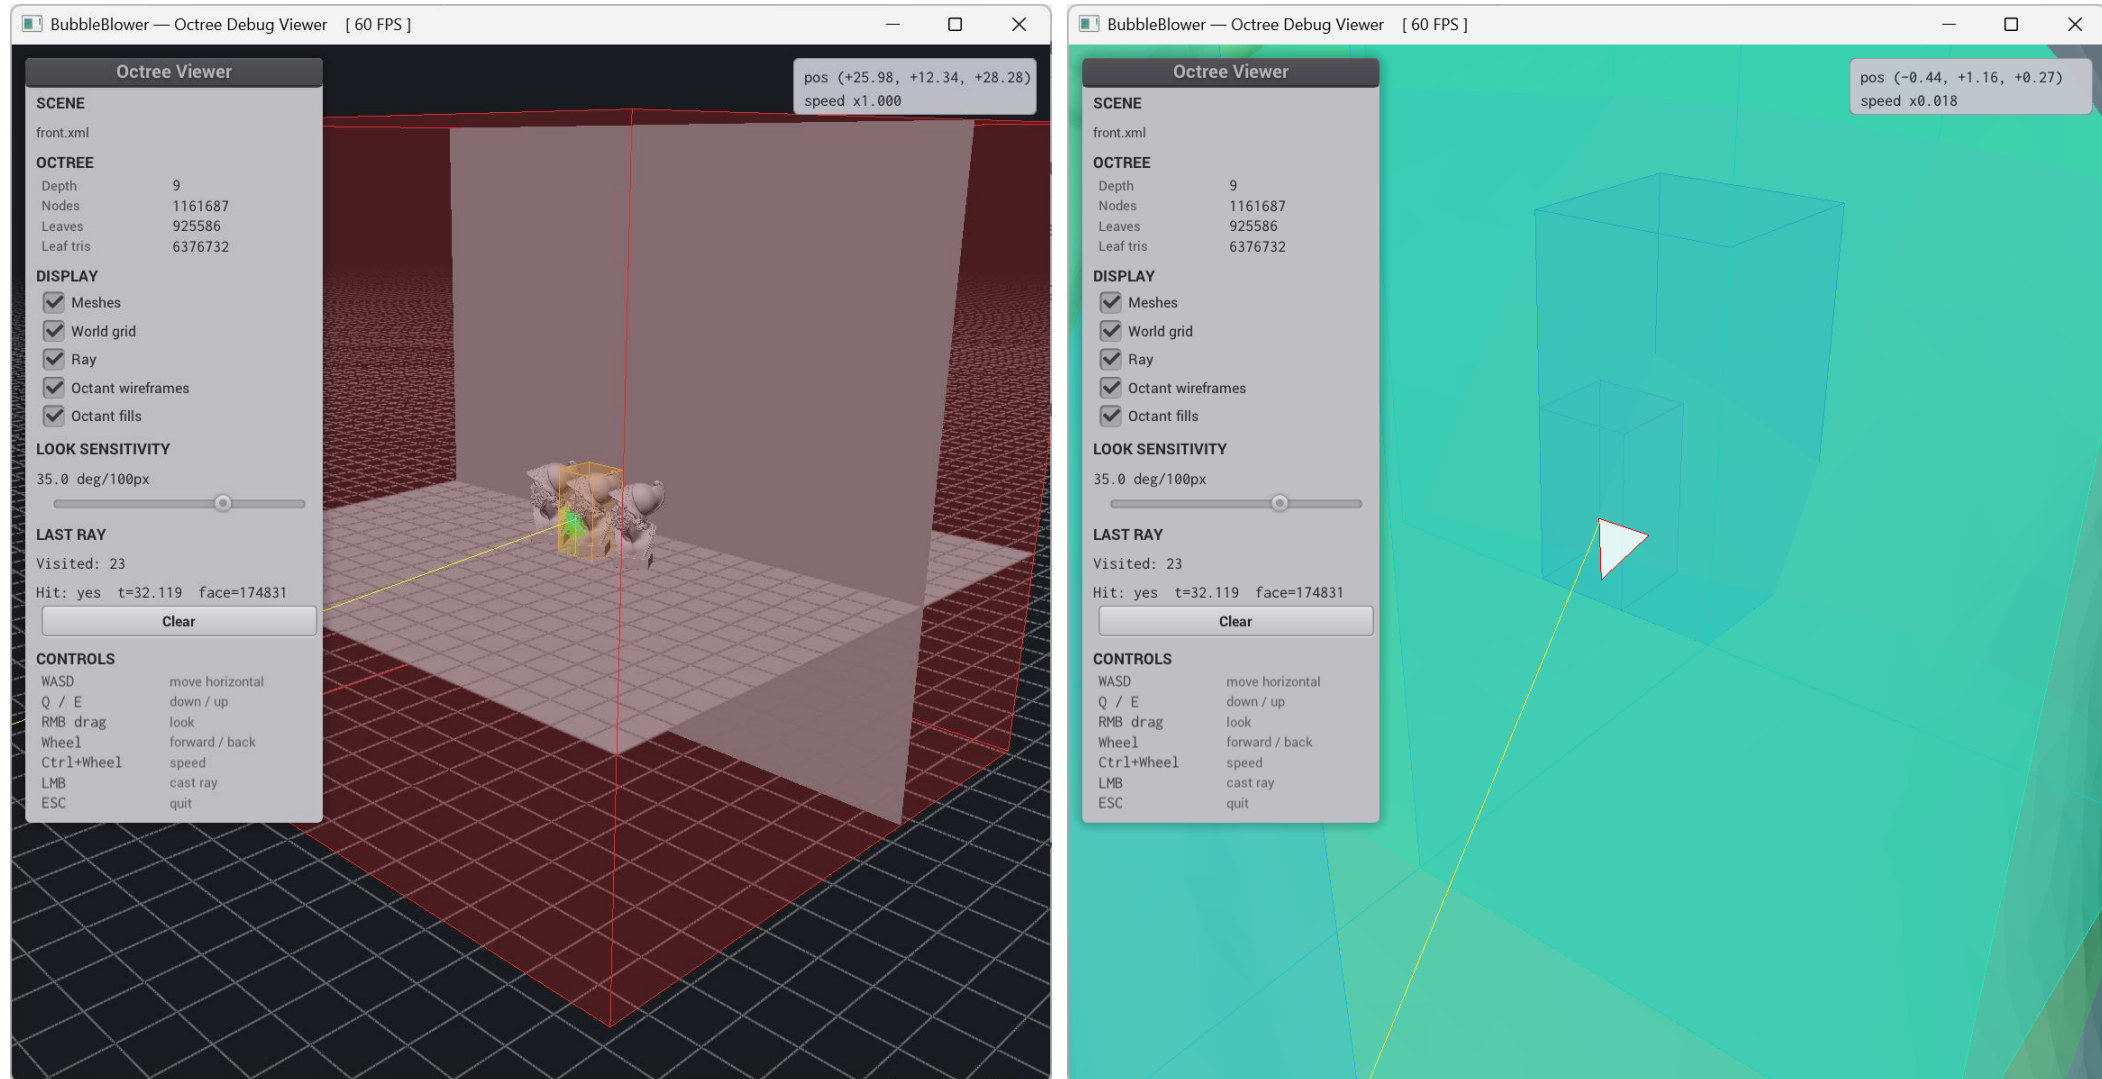

# Test Scene: Ajax bust

---

- Ajax busts are present in a row with different material parameters (scenes/ajax/front.xml)
  - Checker material is provided; Check your skeleton repository

# Demo: Octree Visualization

Sample views of the Ajax bust test scene

# Task List

---

- 1. Implement Whitted ray tracer and verify it by the sphere test scene [16 Points]**
  - Use the sphere test scene to prepare result images for the report [1 Points]
  - Render the diffuse sphere correctly [5 Points]
  - Render the mirror sphere correctly [5 Points]
  - Render the glass sphere correctly [5 Points]
- 2. Implement the octree and verify it by the ajax bust test scene [13 Points]**
  - Use the ajax bust test scene to prepare result images for the report [1 Points]
  - Render the diffuse ajax correctly [3 Points]
  - Render the mirror ajax correctly [3 Points]
  - Render the glass ajax correctly [3 Points]
  - Speed-up more than 10% relative to the simple Whitted ray tracer is achieved when using the octree [3 Points]
- 3. Write a report [1 Points]**
  - Describe your submission in detail; anything is fine, but it should be meaningful and persuasive [1 Points]
  - E.g., implementation details, pseudocode for your algorithms, analyses about memory efficiency, computation speed or performance-related metrics, or etc.
  - Attach rendering images to back up your arguments
  - Write your name, student id, GitHub username

**Accept your PA3!**
